

TRACKFLOW

AI Tracker – Usage Overview

Executive Summary

The AI Tracker is a creative interface for AI filmmakers, designed to make it easy to design, refine, and manage film shot prompts. It acts as a central hub where prompts can be built visually, references such as props, characters, and environments can be organized, and all creative inputs are stored in a project-oriented database. This makes the process of AI-assisted filmmaking structured, repeatable, and efficient while supporting creative freedom.

In addition, the AI Tracker brings transparency and trust to AI-driven content creation. Prompts, input assets, and output movies can be stored and, if needed, secured on blockchain to provide clients with full traceability of the creative pipeline. This ensures authenticity and provenance while also enabling cost analysis per user and project, giving both filmmakers and clients confidence that the creative process is accountable and verifiable.

Shot Setup

- Specify **shot length** (standard AI rendering lengths).
- Enter a **shot name** for organization.
- Select the **AI model** (e.g., OpenAI, Gemma 3, Comfy UI, Veo 3, ...).

Reference Images

- Choose and preview a **start image** and an **end image** for the shot.
- Browse reference images by category (props, backgrounds, environments, characters).
- Tag images with descriptions and scene usage notes.

Prompt Editor

- Write a detailed **AI filmmaking prompt** in a large, dedicated editor area.
- Combine visual references and descriptive tags to guide AI rendering.

Workflow & Data Management

- Each prompt (with images, tags, and metadata) can be **captured and stored** in a database.
- Enables filmmakers to **track, retrieve, and refine** prompts across multiple shots.
- Provides a structured creative process — from ideation to production-ready AI render instructions.
- Possibility of saving **all prompts used to create a piece of content**, together with **input assets, output movies, and the creative pipeline**.

- Optionally, all these elements can be **secured on blockchain** to guarantee **traceability, provenance, and authenticity** for clients.
- Supports **traceability and cost analysis per user and per project**, ensuring accountability and transparency in AI filmmaking workflows.

API Schema for AI Filmmakers

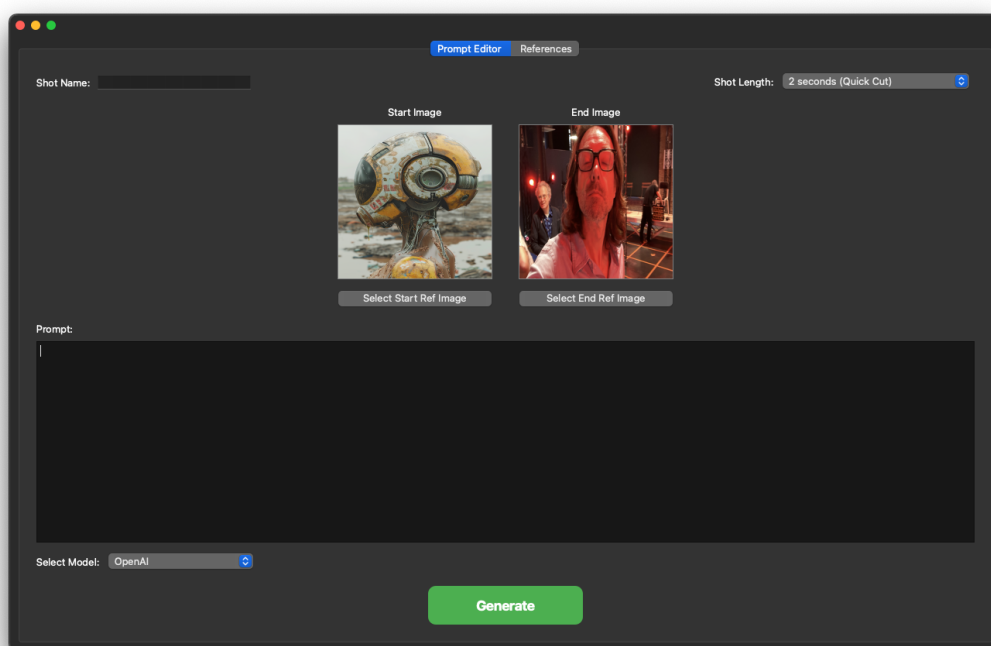

The AI Tracker provides a structured REST API for project integration, automation, and traceability.

Example endpoints:

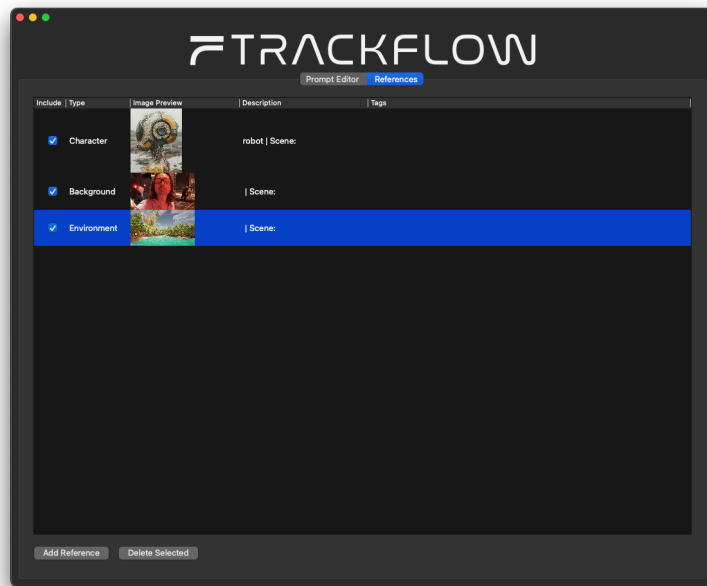

- POST /api/ v1/projects – Create a new filmmaking project.
- POST /api/ v1/shots – Add a new shot with metadata, prompt, and references.
- GET /api/ v1/shots/{id} – Retrieve details of a specific shot.
- POST /api/ v1/references – Upload reference images (props, characters, environments).
- GET /api/ v1/references/{id} – Retrieve reference image and metadata.
- POST /api/ v1/prompts – Save a prompt associated with a shot.
- GET /api/ v1/prompts/{id} – Retrieve prompt history.
- GET /api/ v1/traceability/{projectId} – Full blockchain record of prompts, assets, and outputs for client guarantees.
- GET /api/ v1/costs/{projectId} – Cost analysis per user and per project.

AI Pipeline Dashboard

Pipeline Overview

Project: Cordoba Movie

Status: Operational

Last Updated: 2025-09-18 14:00:00

Total Requests: 15234

Success Rate: 98.7%

Token Cost (€): 245.5

API Endpoints

Name	Path	Method	Status
Text Generation	/api/v1/text/generate	POST	Active
Image Analysis	/api/v1/image/analyze	POST	Active
Data Processing	/api/v1/data/process	POST	Maintenance

API – OpenAPI Schema Screenshot

POST /auth/login Login and obtain JWT (for API clients)

POST /auth/refresh Refresh access token (if refresh flow implemented)

GET /users List users (admin)

GET /projects List projects visible to user

POST /projects Create project

GET /projects/{project_id}/pipeline Get pipeline config for project

PUT /projects/{project_id}/pipeline Update pipeline config (admin)

POST /projects/{project_id}/requests Create an AI request (issue a job)

GET /projects/{project_id}/requests List AI requests for project

GET /requests/{request_id} Get request status & metadata

DELETE /requests/{request_id} Cancel request (if pending)

GET /requests/{request_id}/artifacts List artifacts for request

GET /artifacts/{artifact_id}/download Download artifact (presigned URL)

POST /integrations/kitsu/sync Push project/task/asset sync to Kitsu

GET /billing/usage Get aggregated token cost / usage per project
